

Team 2 Proposal for Amazon Emerging Talent Programs Team

The business context

Amazon Emerging Talent Programs Team is responsible for finding candidates finishing T-level courses to set them up for a future career with Amazon. Amazon as a multi-trillion organisation can provide lots of job opportunities from those coming from technical levels which specialise in real world application learning which can directly translate into Amazon's work environment. Amazon has a variety of sectors which can provide job opportunities for everyone. For example, working in software such as Amazon shopping, prime and music is massive sites that require constant updates, this provides a constant growing work force for these sectors that is growing indefinitely as the largest e-commerce shopping site. Additionally, Amazon supplies lots of hardware such as Amazon Alexa's and kindles. allowing wider communication and is also good for those who want to be a part of assembly of products, this could also include further designs of upcoming products and more further proving the large variety Amazon provides.

Currently, we have been proposed with a problem to develop a new digital solution for Amazon so students can apply and start to engage into career opportunities with Amazon. there is a high demand for young recruits interested into joining the Amazon workforce. This means that, a solution needs to be developed that can act as a direct application portal for young adults to engage in to see the scope of what Amazon can offer. The demographic for this should reach out primarily to students and others who support to start their post education career. This includes careers advisers, parents and teachers. Amazon is boosting support for T-levels greatly with this scheme as they are not as recognised from other primary job and university providers.

Problem overview

T-Level Students

The problem with the current system is that it limits the information that T-level students and future apprentices have access to this means that information about what work experience and apprenticeship offers are being offered is hidden so Amazon will struggle to get talented people applying for their apprenticeship and T-level offers.

Careers Advisors

Career advisors are also going to be limited on what they can find in terms of work experience to give to T-level students. Therefore, they may go elsewhere which decreases the number of students that Amazon may take on.

Amazon's Emerging Talent Program

Amazon also wants to be able to collect information about people that look at their website for example, how long they spent on the website or how many people signed up to Amazon's website. This information is useful for Amazon because it will inform Amazon whether a specific person is a T-level student or an Apprentice, this will allow Amazon to show more of what they are interested in, to them.

A benefit of Amazon implanting something that shares information to T-level and apprenticeship students is that they will be training more people for what Amazon needs, this will mean the people who do the T-level and apprenticeships Amazon offers will likely go into a job with Amazon as they are specialized in what Amazon is wanting so they will be getting more employees, this will help Amazon mitigate the number of people leaving the company from being an issue.

Scope

Provide information and advice about T Levels in general and at Amazon:

- HTML/PHP index page, the place users will be brought to when googling amazon T-Level placements
- A mix of research done up to the point of creation, should have links to other pages easily accessible
- for people that have trouble seeing, the font size can be slightly increased and margins increased so it is easier to navigate the website

- Adding text and information regarding the Amazon placement and T-Levels.

Provide access to digital content to support customers (students, schools and people around students) :

- links to downloads or sources to help whoever is viewing the page with general needs

Allow Amazon to collect expressions of interest from all customers:

- HTML website will need an information collection page
- MySQL can be used to then store the information in a database
- We will need to learn PHP if SQL is to be linked to HTML web page

Downloadable content and content you need to sign up for with credentials:

- this is a customer suggested feature
- to meet customer satisfaction without too much effort a sign in / log in page should be created
- shouldn't pop up on homepage since it'd push customers away, should only be able to log in from log in page or as a pop up when specifically required
- We can use the number of downloads to gain expressions of interest

Accessibility features for users with sight loss:

- this is an accessibility thing so should be treated with importance, and other accessibility options should be integrated to allow access to more users.
- Text to speech (TTS), is not currently applicable to the website due to the current inexperience using PHP throughout the whole group, but after looking at possible solutions to adding TTS it may be more viable after we gain more experience through this project
- dyslexia mode is simple enough, use PHP to change font to a dyslexia friendly one and have a font size toggle too
- have a dark mode set up
- We need to think about sight loss as part of the requirements

Social features:

- We plan to make a contact us page that will have the contact information for Amazon's talent team
- This page may have a form that allows school staff/ careers advisors to contact the team.

User groups

T level students

Age range: 16-19

This type of user group would be looking for any opportunities of work placements and networking with people with similar interests to either finish their T level application or try to obtain an apprenticeship. Usually, they would research for companies that would be interested to take T level students and contact them for any future opportunities of an interview.

For the digital system, T level students are looking for work placements to learn new skills as well as adapting to the industry standards so they can learn the etiquette of an employee in a working environment. Few T level students may have work experience before starting their T level course. I identified this user group from the brief as the Amazon talent team said they want to provide access to students, schools and people. This user group also faces drawbacks from finding work placements such as rejected applications, companies not taking T level students and not getting the right information. They may also fail to find work placements as they may not send their applications in time, or the work placements are filled along with not having the skills to get the role. However, we can mitigate the risk by ensuring the digital system would be able to prevent this type of situation.

Careers Adviser

Age range: 21-40

Careers advisors are responsible for helping students and job seekers by providing additional support about their careers while managing good relationships to the clients to understand their needs and guide them to help them think broadly about their options and make their own path to the future. Along with helping students, they may also help with people who are currently unemployed or planning to their career.

They would use the system to log people's data about their employment or their future destinations to keep on track of their status and make appointments with them. I identified this user group by their main skills of their job such as communication which involves negotiating with clients and managing their own tasks under a short period of time. This is since they would require finding companies for the T level students that suits their own interests and provide the right information about work placements and offers while suggesting looking for more work opportunities as a backup. They would also use this system to contact Amazon's team about getting their school or organisation involved with their program.

Amazon Youth Talent Team

Age range: 18+

We've identified Amazon's Youth Talent Team as a user group as they are the client and have requested that we create a solution that will "provide information and advice about T-Levels in general and at Amazon" and to collect "expressions of interest from all customers".

They would use the system to communicate with other user groups such as careers advisers and T-Level students. With the system, they can determine if the student is in the right position to take the role of their team and provide enough information to a student to see if Amazon is suitable for them. Therefore, the right person would be added to the team and apply any changes to the system such as adding more accessibility features to people with sight loss and making a user-friendly experience. I easily managed to identify the user group by their principles to create a personalised system for the clients to be able to interact and make it easier to navigate. They may also deal with the recruitment process to hire the right person into the team therefore the process can take longer to complete. Amazon Youth Talent Team would essentially look for young talented people who would be able to meet their standards and focus on training them to become more successful in their job.

User Stories

Users	User's wants	Users' reason	Acceptance Criteria
T level students	- Find companies that offers work placements and apprenticeships - Networking with people or companies with similar interests	To be able to complete their T level course to continue their destination whether to find an apprenticeship or get a technology job they're interested in.	- The digital system should allow the T level students to log in or register their account by having a login button to access the website and successfully log in. - The website would allow the students to research for internships for relevant information about a specific course and send applications through the website.
Careers' advisors	- Help young people to find their own destination or giving them additional support when needed - Keep on track of student's progress of the semester and place appointments	To hear what students what they to want to do and provide support to young people who are struggling to think about their future as well. Getting the student's input about the future would	- The digital system would allow the careers advisers to be able to communicate with the youth team and interact with students. - Along with interacting with the students, the digital system

	to targeted students • Provide additional support to job seekers that plans to change their career or currently unemployed	help them give the right information especially for T level students who are looking for internships that would be.	should allow the career advisors to view a table of people who's on a work placement or a list of people who's looking for a work placement. This system should allow them to be able to send information about the student and school so they can have better connections with Amazon if it requires a staff or a careers advisor to communicate them first.
Amazon Youth Talent Team	• Identifying young people that are talented • Offer T level programmes to the targeted audience that are willing to contribute and contact people that they're hiring	• By identifying the people who has the most potential, they would recruit few people from interviews or internships and train them up for upcoming projects and offer an	• Using the digital system, they can provide information about T levels and apprenticeships and log notes for reviews and placements progress. • They should also be able to view every Amazon

	Track on people they're interested as well as allocating employees to the right role positions.	apprenticeship or a job if they meet their standards. Be able to hire new people to ensure that Amazon is not understaffed or over staffed.	employee in the department so they can track what they need to hire and find people who has interests of earning a job in Amazon. Contacting with Amazon would also require a contact page so students can get in touch for any future work placements.

Empathy Maps

T level students	
<u>Says</u> - I need to find information about Amazon's offers for T-level and apprenticeships because there isn't any on the main website - Should I email Amazon about information for t-level offers - Does Amazon offer apprenticeships or T-level offers?	<u>Thinks</u> - There should be a centralized spot to find information about Amazon's T-level offers and apprenticeships - There's no place to put contact information to get information - Is Amazon even aware of T-level offers
<u>Does</u> - People cannot find application for apprenticeship. End up not getting noticed nor hired - People end taking up over t-level offers as they are easier to find and get information about	<u>Feels</u> - lost and confused - can't find any information about Amazons apprenticeships or T-level offers - stressed - cannot find where to apply for apprenticeships

Ends up not sending emails to Amazon about information	Paranoid - doesn't know how to properly email Amazon about t-level offers
Careers Advisor	
<u>Says</u> - Is there a dedicated place to contact Amazon about T-level offers, apprenticeships and placements. where is the website for it - Students should look for placements elsewhere as it's too much effort to find valid information about Amazon's placements	<u>Thinks</u> - Students shouldn't look forwards to Amazon apprenticeships as it's difficult to find information and get hired by them - It's simpler to look for placements elsewhere as Amazon is taking too much time to research about offers and to respond to emails
<u>Does</u> - Ends up going to another company because it's easier to sort out placements from other companies with dedicated places and information to sort out placements and T-level offers - Ends up ignoring Amazon for placements and suggests other places to have an easier time	<u>Feels</u> - overwhelmed - has to sort out many placements and has to disclose Amazon because it takes too much effort to sort anything out - Wasted time looking for information when I could just move to another company

Amazon Youth Talent Team	
<u>Says</u> What emails do I respond to. all of them are differently formatted and there's no automated system to manage apprenticeships	<u>Think</u> - We need to make a standardized/centralized place for all the information about T-level offers and apprenticeships - it's easier for students to find over T-level offers as it's easier to find information on them

its hard to find students who are fit for a Amazon appetences	
<u>Does</u> - Needs to do a slow and manual recruitment process just to hire a single person - Needs to reject many unqualified or overqualified applicants	<u>Feels</u> - disappointed - there's no place for t level students to make applications for T-level offers - annoyed - gets many emails from students who don't give to much information or to much information leading to excess reading or ignored emails

Alternative Solutions

Unifrog

What does it do well:

- Unifrog has a simple design which makes it easy to navigate, this is useful because if the website we make was difficult to navigate then students are going to click off the website and look elsewhere.
- Unifrog doesn't have long load times making the user experience feel smoother which is important as people aren't likely to wait for a website to load the user is more likely to use competitors if the load time is long.

What doesn't it do well:

- Unifrog has lots of information on things other than the T-levels and apprenticeships which could make students feel overwhelmed, so there a lot of redundant information.

What could we take from Unifrog:

- the fast load times should be considered as the website won't be used as much without it.
- the simple design is useful as it makes the website feel less overwhelming to people that aren't used to it.

Source link:[Home - Student - Unifrog](#)

Amazing Apprenticeships

What does it do well:

- The website has a lot of information about Apprenticeships and T-level in general.
- The page has a link for t-level offers where you can register for placements with information about the job.

What doesn't it do well:

- Doesn't categories different T-level courses.

What could we take from Amazing Apprenticeships:

- Displays the number of employers supported.
- Gives a lot of information about t-level and apprenticeships.

Source link: [Amazing Apprenticeships | Explore Technical Education & Apprenticeship Opportunities](#)

Above

What does it do well:

- Above provides a way for people to apply for T-level placements.
- provide additional information about T-level.

What doesn't it do well:

- Above teaches about what a T-level is which is good, however the people that will visit the website are likely to be people already on a T-level and are looking for a placement so the application process should be one of the first things that is shown.

What could we take from Above:

- A way to contact them through email.

Source link: [Above T Levels - Above](#)

ApprenticeLeague

What does it do well:

- ApprenticeLeague shows what apprenticeships are being offered by different employers.
- It shows a list of companies that are offering the most apprenticeships.

What doesn't it do well:

- There's no way to turn the colour from to black for people with visual ability issues.

What could we take from ApprenticeLeague:

- The page displays statistics. including the level of apprenticeship.

Source link:[Digital Apprenticeships — 130 Live Vacancies | Apprentice League](#)

The functional requirements

Amazon has given us a brief of what they would like to develop, this concludes:

- Information about T-Levels in general and at Amazon /
- Access to digital content to support customers (students, schools, people around students) /
- Allow Amazon to collect expressions of interest from all customers. /

As well as these ideas for development, Amazon has stated that customers have also suggested potential features, such as:

- Downloadable content as well as credential sign up to access content. /
- Accessibility features for users with sight loss
- Social Features /

General information

On the website that we are going to develop, we can meet the criteria of providing T-Level information to users by creating an information-filled webpage and different sources to expand the user's knowledge of the T-Level so that it can be easily accessed by users that are interested in T-Levels and Work Experience at Amazon.

Access to Digital Content

This webpage could be accessed by adding a button that navigates the user to a different webpage, this button should be large so it can be seen easily as well as become more accessible as there was a suggestion to make the website more accessible for people with sight loss, this can benefit the suggestion from users that have forwarded this idea to Amazon so that users with sight disabilities can easily access information as it will not be difficult to navigate the webpage that displays the T-Level information as it will stand out with either large text, a bright border or a bright background on the button.

Expressions of Interest

For access to digital content to support customers, there should be a sign in function so that students may get more in-depth information and content based around T-Levels, this could make it easier for students to understand as they will know what specific skills, they would need and at what level they will need to have to easily participate in the work experience, as well as a school sign up so that there is easy access contact to staff in Amazon that have roles based around helping in T-Levels so that they can talk through what students may do, making a more social website as it could be messages or calls for contact.

Social Features

As customers want social features, the website could include a AI chatbot, as it states that an AI may be integrated into the system, this means that there will be 24/7 contact with AI to ask queries and find out information about the T-Level, as well as using AI, there could be a feature of calling a staff member or messaging them to ask questions about what the T-Level gives and what is included in it.

Accessibility

For accessibility with sight loss, there could be a settings page that has a colour-blindness friendly mode that makes it easier for people who have less sensitivity to colours be able to see the website clearly, as for people with blindness or poor eyesight, there could be a text to speech bot or narrator implemented as well as font scaling so that it will be scaled to a comfortable size so the user can read information.

Non-functional requirements of the solution

Fast webpages

For Amazon's website for T-Level students, it would be better for satisfactory if the website had fast loading speeds as it will not require waiting for the next webpage to load, this will also increase interest in the website as users are quickly brought to attention with T-Level and its involvement with Amazon, however, if the interest time is short, that would mean that the website is not appealing to the user, so there could

be videos added into it so that users can watch them to gain even more information about T-Levels.

Amazon's branding

The Amazon logo and colour scheme is required for the Amazon website, so it is easily distinguishable from another website and clear to tell that it is an Amazon website. This isn't a functional requirement because it isn't needed for the website to run however it is a non-functional requirement because if the website doesn't fit the same style as the rest of the Amazon website, then the website will feel out of place and poorly made.

Passwords/Encryption

Password encryption is extremely important because if the passwords that are stored are not kept encrypted and a data breach were to occur then the passwords would also be leaked however if they were hashed then even with a data breach the passwords would still be safe as they would be extremely difficult to decrypt, keeping the passwords safe is crucial as if they were to leak then every account Amazon users have would be easily accessible to the hackers that stole the data this would cause the company face lots of lawsuits from the people that had their accounts hacked.

Data security/MFA

Accounts need to be safe to avoid data leaks, so security is a requirement for the website even if it isn't needed for the website to be functional. One way of making accounts secure is to use two factor authentication which will mean that even if a hacker gets hold of a password and email someone is using they will still not be able to log in because they cannot authenticate to get past the two factor authentication.

Database Robustness

A maintainable and robust database is necessary for Amazon because they are a large company that will have lots of people that sign into their

websites so the database needs to be easily maintainable and robust so they aren't wasting time going back to change old code. This will save time that could be used on something else in the future.

Decomposition of the problems that will need to be solved to implement the functional and non-functional requirements

Non-Functional Requirements

Fast webpages

To make fast webpages we will need to use good programming practices to make more efficient code to reduce loading times for a better use experience.

Password Management

We planned to use some of the built in HTML tags that obfuscate the user's password when it is typed in. Potentially, we could use different ways to encrypt passwords for our database. Preventing SQL injections is part of our plan for securing our solution to stop people from stealing user information to adhere to legislation and maintain trust.

Database Robustness

Our group will need a detailed database design and structure that covers all the user groups that we may collect data on.

Functional Requirements

General Info

We have been provided links to key information about Amazon, the T-Level course and the T-level Placement which we will be on our website to show user

groups like careers advisors or students what Amazon are looking for, what the placement will look like.

Access to Digital Content

Our webpage will have buttons and links that allow the user to navigate around to access different content that is related to them such as a course specific T-level placement

Expressions of interest

To get expressions of interest we planned to create a sign-up form for students and for school staff. This will be implemented by having a sign-up sheet on the targeted user's page with different needed based on what user group they fall into. This data will then be stored for things like analysis.

Social Features

Customer feedback from the client's research has identified that customer's want social features as part of the solution. To add this

Accessibility

Other customer feedback has suggested that they want accessibility features for users with sight loss or poor eyesight we've done research to potentially integrate a text to speech feature, font scaling and the ability to change font.

Amazon's branding

We have been provided with the hex codes for Amazon's colour scheme and some images that are part of Amazon's brand identity.

Key Performance Indicators (KPIs)

expression of interest

An important key point indicator that would be useful for amazon to see is expression of interest (EOI). For example, the total monthly submissions into the website categorised from students, careers advisers and

teachers to see who is using the system the most. This is important as it can show how the system should be tailored to most users for future updates. EOI is also important as the data can be converted from those who submit an EOI to then actually apply for an amazon T-level placement. This overall will provide information on how useful for software has been for applicants. If it is at a low end the system is ineffective, However, at a high end it will be proven to be highly affective.

account interest

Another important analytic is account registration rate. This shows the percentage of users who have registered for an account across a timeline. This is important, because it can show the high point of when people apply. This can be useful as advertisements can be pushed out at key points to attract more T-level students. The account registration should also include what T-level sector they are enrolling into. This provides data that can be used to show what T-level courses are thriving and those that don't gather much attention. This data could then be used to support advertisement data for certain sectors to attract more Students. This could be done through online ads or pop-up careers fair for students.

system scalability and performance

Additionally, another metric that should be measured is system scalability and performance of the system. An example to measure this includes platform availability. For example, measuring site uptime to ensure availability through nationwide application spikes. we can also see the consequences of these spikes and possible mitigation techniques. Additionally, seeing page load times is important as if it's too long user interest will decrease and more mitigation can be done to decrease load speed if it's too slow.

accessibility

Finally, another important KPI to be measured is accessibility. For example, we can view how often accessibility features get used so could have an order of hierarchy to display the most used feature. Additionally, upon sign up we could include a question asking if they have any accessibility needs where these settings can be automatically applied when the account is made. This means we'd gather data from every user which gives a fair range of use from each user.

User Acceptance criteria

T-level student

- Fast loading time for each page
- View available placements and filter for my specific courses
- Have relevant information about a specific course
- Apply directly for placement through the website

Careers' advisors

- View a table of everyone on an Amazon placement
- Have a filter for long term and short-term placements
- Able to send school information to have better connections to Amazon

Amazon Youth Talent Team

- Able to log notes about review and placement progress
- View how many placements are currently going on
- View every Amazon employee allocation so departments aren't over staffed with placements or understaffed

Laws, legislation and Guidelines

Copyright

Copyright is a crucial aspect of regulation when developing a website for a company. For example, copying code straight from other websites without permission and copying ideas is plagiarism. To avoid this, it's important to keep designs unique to not dispute legal action. We can use open-source repositories such as GitHub to access a library code that can be utilised efficiently to use samples of code and the can be personalised to the set brief. Imagery used must be taken from open sources to not infringe upon laws also. This can be performed by visiting websites that allow images to be used for free. This is a cost-effective solution as we don't have to pay licenses for certain imagery as working with amazon, we should have access to Intellectual property such as logo's we can utilise so the branding can be suitably displayed.

Data Protection

The GDPR (General Data Protection Regulation), effective since May of 2018, is a protection act that companies must follow legally. The GDPR defines how companies may process client data and sets rules around their rights to privacy and how companies use, store and transfer data without breaching the clients forementioned rights. This is why it is important to have a secure database where we can safely store personal information the user will enter. This will prevent legal actions from the company and keeping good reputation with clients.

Cultural Appropriation

Throughout the project, we will take proactive measures to prevent cultural appropriation and mitigate algorithmic bias. Ai frequently inherits bias in training data which leads to stereotypical portrayals. Our team doesn't rely purely on automation and must implement human action also. Another important factor are fonts and using novelty fonts that mimic ethnic backgrounds that shouldn't be included as it creates an unethical layout that may offend people.

Risks

GDPR and breaches

As we are gathering data mainly from teenagers from an age range of 16-18, we must take precautions regarding safeguarding measures that align with the GDPR exposing data of minors can leave amazon financially responsible causing lots of debt. To do this we need to have consent from them with clear consent checkboxes and links to T&C's clearly stating what data is gathered. Additionally, we need a secure backend database. Having data stored in plain text exposes sensitive info which can cause sever data breaches which again causes amazon hefty fines. to prevent this, we are keeping the database very encrypted. Additionally, we will factor in password security this includes hiding what is typed in to prevent shoulder surfing. Also, we may have double password entry to increase security. Student personal details will be visible inside the site which is why it's important to prevent unauthorised access.

Time management

Another risk to the project is allocating enough time to each part. After overview this is a large task where we need full collaboration from a whole team with set tasks that need to be completed promptly so we can move on efficiently. This means as a group we need full attendance and commitment to work. Without this we will fall behind and won't meet deadlines. Additionally, the tasks allocated have complicated parts that may be hard to overcome in the given deadline. This means to ensure completing on time we may need to cut certain parts.

Description of the proposed solution (NOT A DESIGN)

Our final proposal is an interactive website that will include the following:

Key features of our solution and benefits:

Accessibility features -

Part of our website is to add accessibility features for users with sight loss. We plan to do this by adding things such as implementing text to speech, different fonts/font sizes, themes, and other features like a high contrast mode. The benefit of this is that it will allow more users to access our solution to get engagement from a broader group of people which will gain more attention and potentially bring in more new talent.

Information -

The focus of this website is to provide information to T-Level students in multiple subjects about the placements that are offered by the Amazon Talent Program Team. This also allows staff such as careers advisors and school staff to find out information about the placement to see if it is suitable for their students. As a result, this will give concise information that will avoid confusion by having hard to navigate pages making the user experience more comfortable.

Downloadable content -

On different pages we plan to have some content that can be downloaded such as PDFs and other documents that give user specific information. This will give clear information to the user about the specific needs. Therefore, this will provide a better user experience by having the information readily available to the user.

Branding -

The client has given my team a guide on how they want the website to be branded. They have provided a colour scheme in the form of hex codes and a brand identity that we can reference when designing our website. This has the benefit of brand recognition as Amazon are a very large company that recognition will attract users to want to sign up.

Social features -

Amazon's customers have shown interest in adding social features as part of the website. We plan to do this in the form of communication between mentors and students. This means that school staff and careers advisors can monitor student activity throughout their time doing a work placement. We also wanted a space for teams to communicate with each other throughout their project. This will make it easier for Amazon and career staff to communicate and monitor T-Level students to understand how well they're doing and how effective the placement is.

Expressions of interest -

To get these Expressions of interest, we are going to have sign up forms for students and for members of staff working in schools and colleges. This would be stored on a database and would give different permissions to the user that create an account. Furthermore, Amazon will be able to gauge the level of interest from students and can use that data to make changes if needed.
